

# HANDRAILS & BALUSTRADES

MODEL NO: ARHN & ARBI

The excellent durability and attractive appearance of stainless steel make it particularly suitable for hand railings and also for components of staircase construction, such as balustrades, strings and treads.

It can be used internally or externally, because stainless steel requires little maintenance and has a high tensile strength to weight ratio, enabling lighter gauges to be used, it becomes a good economic proposition in architectural installations.

Southern Cross Stainless Steel handrails and balustrades may be fabricated to any custom design using stainless steel tube in round, square or solid stainless steel bar.
