

PNEUMATIC PUSH BUTTON KIT INSTALLATION & MAINTENANCE

MODEL NO: PAPE
PRODUCT CODE: PA2102

- Remove button from package and test for correct operation by depressing button whilst holding finger over end of plastic tube. A different air pressure should be felt.
- Before installation, connect button hose to cistern and test for performance of cistern and button.

NOTE: maximum length of hose is 2.4 metres.

- When installing push button thorough pre drilled hole in wall, ensure no dust or grit is evident as this may contaminate the internal components.
- Once button is in place, tighten the lock nut (do not over tighten). Check to ensure there are no kinks or tight bends in plastic hose as this will reduce the air flow.
- Connect air hose to the installed cistern using the adapter tube supplied. Once all plumbing work is complete the button should be flush tested.

MAINTENANCE

All buttons are pre-tested in our factory and lubricated with a light lubricant. The only servicing that may be required is a 3 monthly lubrication with a light lubricant.

This can be carried out from the face of the button by spraying a small amount of the light lubrication when the button is depressed.
